

Nokia Intellisync Mobile Suite

Connecting Business People to the information they need

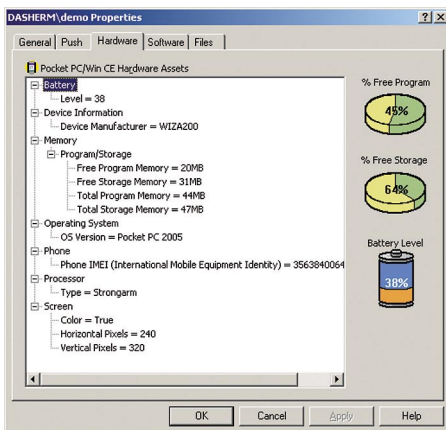

Nokia for Business

A Complete Mobility Solution for Wireless Email and Beyond

Nokia Intellisync Mobile Suite is a comprehensive platform that provides everything you need—all in one place—to support your enterprise mobility strategy. It delivers real mobility for the exceedingly diverse range of mobile devices in use today, and connects employees to almost any back-end enterprise application they need to use.

Device Management

From a single console, Nokia Intellisync Device Management lets you keep track of and manage mobile devices in the field, and even remotely deploy and update applications. You can also enforce your mobile security policy across the broad range of devices you may have deployed in your enterprise. And the solution lets you empower your mobile workers with a self-service administration page to manage their own back-ups and theft/loss procedures, such as device lock and wipe, even on removable media.

Wireless Email

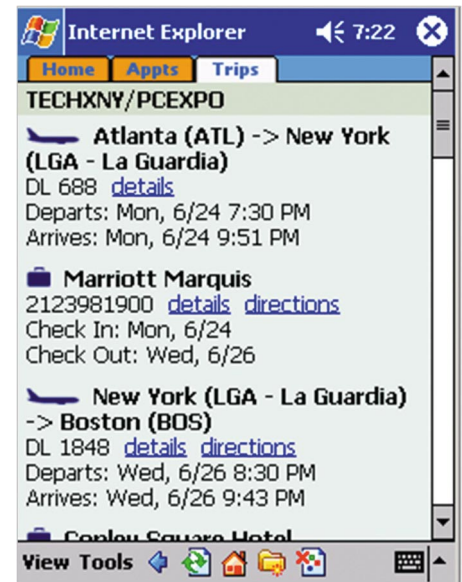

Nokia Intellisync Wireless Email is a full-featured wireless email application that lets users easily and rapidly access their email, calendar, contacts, notes and task lists on almost any mobile phone. Users can download attachments, respond to meeting requests and manage subfolders while on the road.

Nokia Intellisync Wireless Email provides compatibility for Exchange, Domino, GroupWise, IMAP, POP3 and XML. Support for older versions of email servers, including Exchange 5.5 and 2000, means you are not burdened with a major upgrade of your email systems simply to enable mobile access.

Designed with 'Professional' clients as well as an unlimited number of 'Base' clients, Nokia Intellisync Wireless Email enables you to deliver mobile email to more employees for less cost.

We've also added next-generation technology to help organize information delivered to the mobile device. Automatic parsing of travel information into an

easy-to-read itinerary page saves mobile executives from searching through numerous emails (or calling the office) for hotel bookings and flight details. It also automatically generates links to maps, directions and weather for the traveller's destination.

NOKIA
Connecting People

The Mobile Suite Advantage

Nokia Intellisync Mobile Suite connects virtually any corporate data source to virtually any mobile device over any network, providing the most choice and flexibility to meet your current and evolving mobility needs.

Nokia Intellisync File Sync is a highly automated information distribution, updating and retrieval tool that enables an entire organization to have the most up-to-date business information and documents—including files, pictures, video, forms, documents, and intranet content—without burdening the end-user. Virtually any type of file or data can be kept synchronized. Information stored in specified network locations can be automatically distributed to a wide range of devices. Additionally, information being captured on remote devices can be automatically retrieved and stored centrally.

Nokia Intellisync Application Sync is a mobile framework that seamlessly integrates into enterprise environments, enabling you to extend and synchronize your most important enterprise applications, data stores and business processes (such as CRM, SFA, FFA, and ERM) to the field, no matter which handsets are deployed. Nokia Intellisync Application Sync provides “mobility beyond email.” Data source-agnostic and customizable, its functionality enables the enterprise to mobilize business processes and provide seamless, reliable access for the varied and demanding requirements of the mobile sales force and business owners.

Nokia Intellisync Call Connect integrates Nokia Eseries devices with your enterprise PBX. The ability to extend the advanced voice features of your PBX—and bring the power of the desk phone to the mobile phone—can improve customer satisfaction, increase employee efficiency, and control communication costs.
